CHEMOTECHNIQUE DIAGNOSTICS

Foreword by Bo Niklasson, CEO

First of all I would like to thank all our faithful customers for your support during the past year and also welcome our new distributors that have been appointed during the year.

Chemotechnique Diagnostic's 34 years of continuous growth and development has been the result of our belief in building strong and long term business relationships with our global network of distributors, combined with the ongoing support and contributions of our product-user base of physicians. Our commitment is to continue serving dermatology in future years... maintaining our leadership position.

During the past year we have invested in new state of the art equipment in both the analytical and production sector and developed a closed loop system in the production of haptens.

When looking at our website you will note that we have made it possible also for patients to freely access our database of extensive information regarding the haptens and being able to print information sheets. We have also changed the site to be adapted to mobile platforms such as mobile phones, iPads and similar devices.

There will as always be additions and amendments in our range and these are found at the end of the Patch Test Products & Reference Manual.

At Chemotechnique Diagnostics, our passion and total focus on contact dermatitis and patch testing is to ensure that you, as a physician, will have the most advanced products and services that will provide your patients with improved health and enhanced quality of life. We look forward to continuing to serve you in 2015.

Chemotechnique Diagnostics

Chemotechnique Diagnostics is recognized as the world's leading patch test company with the widest global distribution network and product range, with more than 550 different haptens distributed in about 90 countries around the world.

Countries (in blue) where Chemotechnique Diagnostics has distributors.

We offer the most complete range of high quality products including haptens (allergens) and test chambers for patch testing in the diagnosis of contact dermatitis. The contamination free haptens are produced under strict pharmaceutical control following the GMP quality management system audited by the Swedish Medical Products Agency (MPA). In addition, our whole operation follows the ISO 13485 and ISO 9001 Quality Management systems. Our products will therefore enable you to perform a valid diagnosis of contact allergy in your patients.

We focus on Research and Development (R & D) to produce new and relevant haptens for patch testing as well as new products in the medical device sector with special emphasis in the field of occupational dermatology.

By cooperating with national contact dermatitis associations in various countries we want to meet the needs of specific regions. We are guided by contact dermatitis groups such as the International Contact Dermatitis Research Group (ICDRG), European Environmental and Contact Dermatitis Research Group (EECDRG) and North American Contact Dermatitis Group (NACDG). With this in mind we believe ourselves to be up to date and able to facilitate dermatological investigations where patch tests are involved. For example, in 2013 Chemotechnique Diagnostics co-authored an article in Contact Dermatitis in cooperation with the University of Gothenburg.

THINGS YOU CAN DO TO HELP MANAGE YOUR CONTACT ALLERGY

Do be vigilant... read the product label. Always take the time to read the ingredients listing on product packages. This should be your first step each time you purchase a product as manufacturers sometimes change product ingredients. If you have any concerns ask your pharmacist or your doctor.

Test the product first. If you have patch tested a new product you should test it on a small skin area to see if you get a reaction before using the product on larger skin areas.

Advise people you obtain services from of your contact allergy. This should include people like your pharmacist, doctor, hairdresser, beautician, etc.

Inform your employer if the source of your contact allergy is work related. You should identify the specific source of an occupational risk and the necessary steps to avoid further reactions. Protection may vary by allergen or you may need to make a change in your work activities. Both you and your employer benefit when the cause of your occupational dermatitis is eliminated.

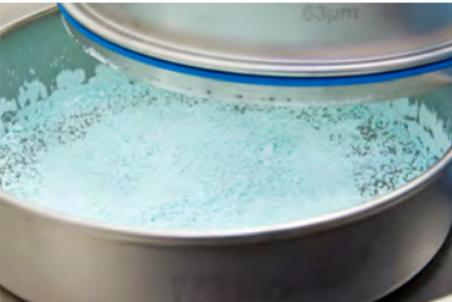

"Smoogle" it. The internet is an excellent source of updated information that can be searched by product, by company and by specific chemical. General information

Change of terminology

The traditionally used "Allergen" is replaced by "Hapten" starting from the 2010 catalogue to avoid using an incorrect terminology. The only exception is Mx-21C; Dermatophagoides mix.

Haptens are substances incapable of inducing an immunologic reaction in

...for the diagnosis of contact allergy

diagnostic in vivo testing as a stand alone compound. A hapten needs to bind to a protein to become an antigen capable of eliciting an allergic reaction and this bond depends on individual biological factors in the patient being tested. An allergen is defined as a full antigen with a capability to elicit an allergic reaction during the patch test procedure. Some examples of common allergens are pollens, cat dander and dust mites.

INCI nomenclature

We still continue to adapt to the terminology of the International Nomenclature of Cosmetic Ingredients (INCI). The transition into these names is motivated by the fact that it will be easier to find the ingredients on labels of cosmetic products. The INCI names are shown as capital letters/upper case lettering in the different tables or texts.

FAQ

How much does a syringe/bottle contain?

A syringe is filled with 5 ml and a bottle contains 8 ml.

How many patients can you test with one syringe/bottle?

At least 150 patients/syringe and bottle.

Which volume should I dispense onto each patch test chamber?

When applying haptens in petrolatum, dispense a string of around 5-6 mm into the test chamber (about 25 μ l).

When applying liquid haptens to the IQ Chamber or IQ Ultra, apply a drop of the test solution by holding the dropper bottle against the filter paper in the chamber (20-25 μ l). The amount should be just enough to properly moisten the filter paper. The preferred method is, however, to use a micropipette.

For how long can I store a preloaded patch test unit?

Most of the haptens can be preloaded on IQ Ultra for up to two weeks. This is if the chambers are stored in a refrigerator. **Do not preload liquid haptens and volatile substances such as acrylates or fragrances.**

Products - Haptens

Haptens

Chemotechnique Diagnostics takes pleasure in offering the widest range of commercially available haptens for patch testing now expanded to cover more than 550 different preparations. In cooperation with various national Contact Dermatitis Research Groups a number of country specific Baseline Series are available in addition to our normal range. The products are available through our extensive network of distributors worldwide.

Chemotechnique Diagnostics has the widest production of haptens in the market offering more than 550 different preparations included in 45 different series.

Substances with a petrolatum vehicle are supplied in 5 ml polypropylene syringes.

Substances in liquid solution are supplied in 8 ml polypropylene dropper bottles.

Haptens should be stored in a refrigerator protected from light. In accordance with their stability, we recommend that all substances should be renewed according to the expiry stated on the labels of the haptens.

Patch testing, being the classical method for the diagnosis of contact allergies, is an important tool when investigating contact dermatitis. This test becomes more reliable when using high quality standardised test substances. The raw materials used in the preparation of the haptens are of the highest purity and treated so that extremely small particles are formed and incorporated in the white petrolatum used as a vehicle. The petrolatum is produced by Penreco.

It is also important that the testing and interpretation of the result is performed by an experienced physician.

Products - Patch test hapten series

International Series

Below is a short introduction to all the patch test series that Chemotechnique Diagnostics offer world wide. The composition of these can be seen after page 28 or on the website. Test record forms are available for all our series on the website

The **European Baseline Series (S-1000)** consists of haptens based on the experience from many years of studies of frequencies of contact allergy performed by the European Environmental and Contact Dermatitis Research Group (EECDRG).

The series can be seen as a basic “standard” baseline series in case no specific country specific baseline series is offered.

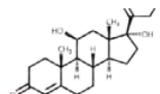

The **International Comprehensive Baseline Series (ICB-1000)** consists of a selection of haptens based on the experience from many years of studies of frequencies of contact allergy performed by the North American Contact Dermatitis Group (NACDG).

The series can be seen as an important addition for those physicians who either do not have a domestic baseline series or want to go beyond the various baseline series offered. The experience has been that a larger routine screening series will produce a higher yield of positive reactions and contribute to a better diagnosis.

The **Bakery Series (B-1000)** contains chemicals and substances which are included in foods. They are mostly frequent in pastries, thus exposing the people who might work in the field. The series mostly contains preservatives and substances valued for their fragrance and taste.

The **Corticosteroid Series (CS-1000)** contains chemicals and substances found in topical pharmaceutical products such as corticosteroid creams and ointments .

The **Cosmetic Series (C-1000)** contains chemicals and substances which anyone could be exposed to using cosmetics and beauty products. The series contains substances which are used for fragrance, preservation, sun protection and vehicles for obtaining optimized formulations.

...world leader in patch testing

The **Cutaneous Adverse Drug Reaction Series (CAD-1000)** contains chemicals and substances present in pharmaceutical products such as antibiotics, NSAID's and painkillers. These pharmaceutical products may cause systemic dermatitis.

The **Dental Screening Series (DS-1000)** contains the original composition of chemicals and substances which one is normally exposed to as a patient or staff in dental care. This series contains primarily metals and plastics.

The **Dental materials - Patients Series (DMP-1000)** contains chemicals and substances found in dental products that patients get exposed to in dental care. The series consists of plastics, fragrances and composite materials used for mending teeth.

The **Dental Materials - Staff Series (DMS-1000)** is a limited edition of the DMP-1000 series which contains chemicals and substances that a person risks being exposed to whilst working professionally in dental care. The series contains plastics, fragrances and composite materials used for mending teeth.

The **Epoxy Series (E-1000)** contains chemicals and substances which one might be exposed to working professionally with epoxy pastes and glues. Examples of chemicals are stabilizers, additives, resins and epoxies.

The **European Photopatch Baseline Series (EP-1000)** contains chemicals and substances which one might find in skincare products which protect against the sun. The series contains chemicals that are UV-blockers, additives and pharmaceutical compounds that may become allergenic after

UV activation.

Note that a special test method is required for this series (including a broad-spectrum UVA source). See page 24 in this catalogue or www.chemotechnique.se for further information.

The **European Photopatch Extended Series (EPE-1000)** is an extended version of EP-1000 which contains additional UV-activated drugs. The series contains chemicals and substances which one might find in skincare products which protect against the sun. Examples are chemicals that are UV-blockers,

additives and pharmaceutical compounds that may become allergenic after UV activation.

CHEMOTECHNIQUE DIAGNOSTICS

Note that a special test method is required for this series (including a broad-spectrum UVA source).

The **Fragrance Series (F-1000)** contains chemicals and substances which one can be exposed to when using perfumes and beauty products. It contains substances which are used for obtaining pleasant odors, preservation as well as aid products in the formulation.

The **Hairdressing Series (H-1000)** contains chemicals and substances which one might risk getting exposed to working professionally in the hairdressing occupation. Examples are chemicals that are coloring agents, stabilizers, metals and preservatives.

The **International Standard Series (IS-1000)** consists of a selection of haptens based on the experience from many years of studies of frequencies of contact allergy performed by the International Contact Dermatitis Research Group (ICDRG). The selection of haptens in this series is set by the ICDRG.

The **Isocyanate Series (I-1000)** contains chemicals and substances which one might risk getting exposed to working professionally with isocyanates. Examples are chemicals that are used as stabilizers or additives in plastics.

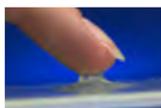

The **Leg Ulcer Series (LU-1000)** contains chemicals and substances which patients can be exposed to when treating leg ulcers. It contains substances which are used for their medical properties, preservation, and vehicles in the formulation.

The **Medicament Series (ME-1000)** contains chemicals and substances which one risks getting exposed to when self-medicating antibiotics and topical pharmaceutical products.

The **Metal series (MET-1000)** contains metals which are present most commonly in jewelry, coins and tools, etc. The series contains all kinds of metals which are found in alloys and in the general environment.

The **(Meth) Acrylate Series - Adhesives, Dental & Other (MA-1000)** contains chemicals and substances which one normally gets exposed to working professionally in dental care

and/or other occupations in which acrylates are used. Examples are chemicals that are plastics and acrylates of different types.

The **(Meth) Acrylate Series - Nails Artificial Series (MN-1000)** contains chemicals and substances which one risks getting exposed to when working professionally in nail shops or when using nail products for home use. Examples are chemicals that are plastics and acrylates of different types.

The **(Meth) Acrylate Series, Printing series (MP-1000)** contains chemicals and substances which one is normally exposed to when working professionally with printing or printing at home. Examples are plastics, stabilizers and acrylates of different types.

The **Oil & Cooling Fluid Series (O-1000)** contains chemicals and substances which one risks getting exposed to when working professionally with mechanical parts and where there is a variety of viscous fluids present. Examples are chemicals that are stabilizers and preservatives.

The **Photographic Chemicals Series (P-1000)** contains chemicals and substances which one risks getting exposed to when working professionally with photography and development of photos. Examples are chemicals that are developers, oxidizers and reacting agents.

The **Plant Series (PL-1000)** contains extracts of plants and substances which people can be exposed to in nature and when using cosmetics and beauty products in so called “natural creams and ointments”.

The **Plastic & Glues Series (PG-1000)** contains chemicals and substances which one is normally exposed to when working professionally with plastics. Examples are chemicals that are stabilizers, plastics/phthalates and preservatives/bactericides.

The **Rubber Additives Series (R-1000)** contains chemicals and substances which one risks getting exposed to when working professionally with rubber in the industry. Examples are chemicals that are stabilizers, antioxidants and preservatives/bactericides.

CHEMOTECHNIQUE DIAGNOSTICS

The **Shoe Series (SH-1000)** contains chemicals and substances which one risks getting exposed to when working with shoes as well as wearing shoes. Examples are chemicals that are tanning materials, coloring agents and preservatives/bactericides.

The **Sunscreen Series (SU-1000)** contains chemicals and substances which one will find in skincare products which protect against the sun. It contains substances which are used for their sun blocking properties.

The **Textile Colours & Finish Series (TF-1000)** contains chemicals and substances which one is regularly exposed to when wearing different types of clothes. Examples are chemicals that are coloring agents and protection/bactericides for the fabrics.

The **Various Series (V-1000)** consists of a selection of haptens which are not included in any other of Chemotechnique's series. The substances found here are hard to categorize and exposure can vary.

National Baseline Series

In cooperation with various national contact dermatitis research groups, there are also a number of country specific baseline series which are available in addition to our normal range of series.

Products - Patch test chambers

Chemotechnique Diagnostics offers two types of test chambers; IQ Chambers™ and IQ Ultra Chambers™. Both test units offer the feature of re-attaching the tape to a stiff plastic cover to prepare test units in advance. For easy and fast loading of the test chambers use the Application Device.

The basic requirements for a patch test chamber involves using an inert material applied to a hypoallergenic tape providing good occlusion and fixation of the test unit to the skin.

The material of IQ Chambers™ is inert, additive free polyethylene and IQ Ultra™ is inert, additive free polyethylene foam and the opening of the chamber has a square form to make it easier to differentiate between allergic and irritant reactions. Undesired side effects in the form of allergic reactions to the test unit itself are avoided due to the chemical stability of the polyethylene plastic.¹⁻²⁴ The effect of reactive test substances on the test chamber which may result in secondary toxic reactions during the patch test, is also avoided due to polyethylene's chemical resistance to these types of substances.²⁵⁻³¹ By using inert plastic material such as polyethylene, the risk of inactivation, modification and absorption of the hapten during contact with the surface of the test chamber is avoided.^{32-33, 35} Considering these facts, the importance and advantages of using chambers made of inert plastic material has been demonstrated.^{31,34, 36-42}

IQ Ultra™

Move up to IQ Ultra™!

Patented Inert Quadrate design provides ease in differentiating between allergic and irritant reactions

Polyethylene foam, inert & additive free. No risk of chemical interaction between the hapten and the patch test chamber

Plastic protective cover - to protect the preloaded unit

Adhesive layer on chamber rim to eliminate hapten leakage

Filter paper in each chamber for easy handling of liquids

High quality surgical tape
Hypoallergenic and latex free

Thin, soft, inert and additive free polyethylene foam maximizes patient comfort

Facilitates advance chamber filling → Improved staff efficiency
Aluminum free and recyclable → Environmentally friendly

Features/Benefits

The IQ Ultra™ patch test unit has important advances:

Each chamber has a filter paper incorporated which eliminates adding loose filter papers to facilitate handling of liquid haptens.

- The rim of each chamber has an adhesive layer to optimize adhesion to the skin and to eliminate leakage. This makes IQ Ultra™ a closed-cell system enhancing occlusion and confining the test reaction within the chamber parameter.
- A defined test area is critical for standardization as the concept of dose/area is valid only for a closed cell and IQ Ultra™ is the only test chamber in the market that has this feature.
- The size of the IQ Ultra™ is small to allow the application of multiple test units to patients' backs.
- The chambers are made of thin and soft polyethylene foam material to maximize patient comfort.
- The highest quality hypoallergenic surgical tape is used for the IQ Ultra™. Each strip of 10 chambers of IQ Ultra™ is attached to a protective plastic cover with corresponding compartments which makes it possible to re-attach the tape after advance filling of the chambers with the haptens.
- The Application device for IQ Ultra™ makes advance filling of test substances even easier. The device is specifically designed for the IQ Ultra™. It is cost effective and saves nurses/technicians time, as they can prepare test series up to two weeks prior to use. Volatile haptens such as acrylates and fragrances should not be preloaded.

Product Information

- IQ Ultra™ is made of additive-free polyethylene plastic foam with a filter paper incorporated.
- IQ Ultra™ is supplied in units of 10 chambers (in 2 rows of 5 chambers/row) on a hypoallergenic non woven adhesive tape.
- The tape with the chambers has a protective plastic cover with 10 corresponding compartments. The cover makes it possible to re-attach the tape to the cover after advance filling of the chambers with haptens.
- The volume of the chamber is 32 µl and the inside area of the chamber is 64mm².
- The width of the tape is 52mm and the length is 118mm.

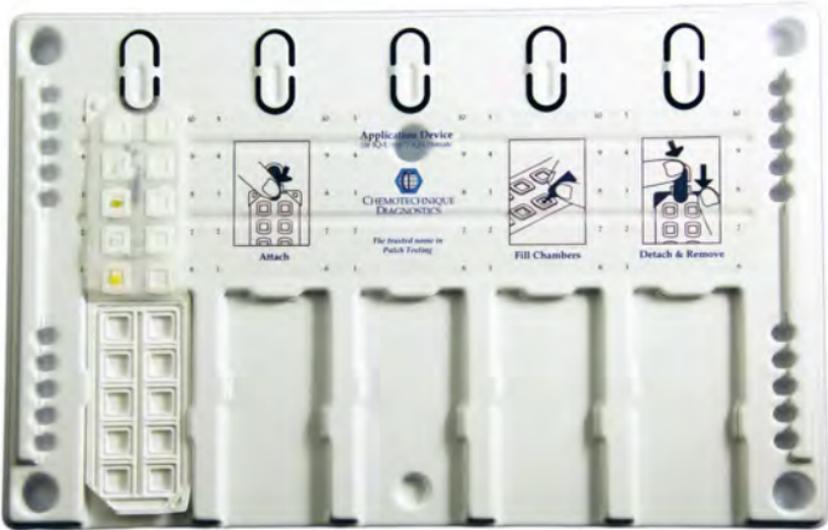

Packaging & Service

The IQ Ultra™ is supplied in cardboard boxes containing 100 units per box (100x10 chambers). A **Reading Plate for IQ Ultra™** is supplied in each box.

For patent information visit www.chemotechnique.se

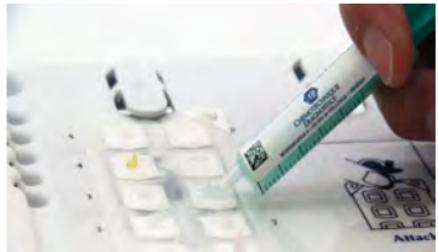

Devices - Application Device

The device significantly facilitates preloading of multiple test units. This is convenient when preparing test series in advance, such as the Baseline series, for a suitable number of patients. The device has a low weight of only 0.3 kg.

The device is equipped with a special function to detach and attach the syringe caps. This eliminates contamination of fingers during the dispensing of haptens.

The design prevents the tape unit from sliding during application of the haptens.

Devices - Chemo Skin Marker

Chemotechnique Diagnostics has developed 3 different markers to mark the patch test site:

Chemo Skin Marker- Regular™: This marker contains Methylrosaniline and Silver nitrate for prolonged staining of the skin.

Chemo Skin Marker- Slim™: Has the same ink and features as Chemo Skin Regular™ except that the tip is narrow thus producing thinner lines.

Chemo Skin Marker- UV™: Suitable for dark skin types or when a non staining ink is wanted.

Devices - Ultraviolet Lamp

We offer a suitable UV-lamp for easy detection of markings made by the **Chemo Skin Marker- UV™**

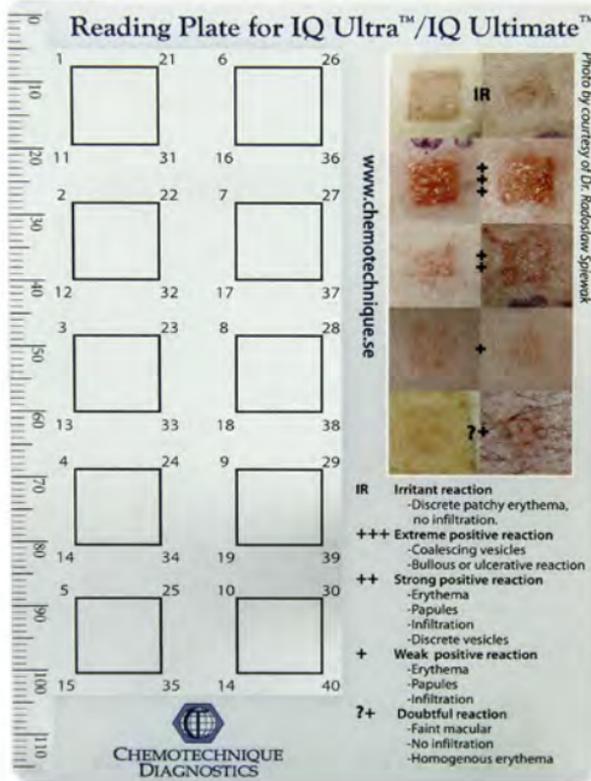

UV Lamp showing the written mark from Chemo Skin Marker- UV™

Devices - Reading plate for IQ Ultra™

The IQ Ultra Reading Plate™ facilitates the interpretation of the skin reactions.

Reading Plate for IQ Ultra™

A range of photos of different types of allergic reactions are printed on the reading plate. A visual comparison with the actual reaction on the patient along with physical inspection of the skin, following the interpretation model as recommended by the International Contact Dermatitis Research Group (ICDRG) will provide the test result.

Patch Testing - Instructions for IQ Ultra™

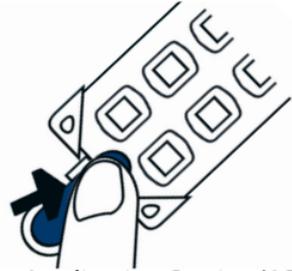

1. Detach one of the perforated corners. Let the corner stay on the tape.

2. If the Application Device (AP-P) is used: slide the IQ Ultra™ unit into the device .

3. Pull back the tape gently until all chambers are revealed. Do not detach the tape from the plastic cover.

4. If the Application Device (AP-P) is used: attach the tape to the device by pressing the clip.

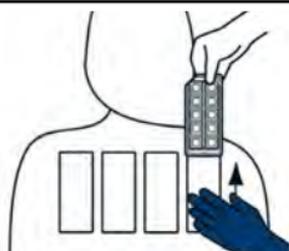

5. Apply the test preparations starting with the first hapten in the lower left chamber. Lower left = upper left on the patient.

6. If the Application Device (AP-P) is used: detach the IQ Ultra™ unit from the clip. Remove the unit from the device.

...the trusted name in patch testing

7. Remove the corner and apply the unit onto the back. Press with the palms on the tape for about 5 seconds.

8. Mark, to the left of the tape, the first and the 5th chamber using the Chemo Skin Marker™.

Patch testing - General considerations

Applying the patch test haptens

When applying haptens in petrolatum, dispense a string of around 5-6 mm into the test chamber (about 25 μ l).

When applying liquid haptens, apply a drop of the test solution to the filter paper in the chamber (20-25 μ l). The amount should be just enough to properly moisten the filter paper. The preferred method is, however, to use a micro-pipette.

Preloading

Most of the haptens can be preloaded on IQ Ultra for up to two weeks. If preloading of the chamber is done for storage in the refrigerator, do not preload liquid haptens and volatile substances such as acrylates or fragrances.

Applying the patch test units on the patient

When applying the test patches on the patient, use if possible the upper part of the patient's back, and avoid applying patches to the midline and the scapula. If several test series are applied, 2 horizontal rows of 4-5 units per row can be applied across the back. In some cases other areas of the body like the upper part of the arms may be used. If the patient's skin is oily you can clean it gently with some ethanol. Unless the patient has very dry or oily skin there is no need to put on extra reinforcement tape to secure the patches. Do not put any test units under a brassiere shoulder band which can cause dislocation of the test units. Please note; press the tape with the palm of your hand for about 5 seconds. The pressure and heat will enhance adhesion.

Precautions

The patient should not take any cortisone or medications altering the immune system during the test, avoid taking showers and avoid exposure of the back to the sunlight.

Record form

Make a record on a record form of the numbers and names of each hapten. For patch record forms, visit our website www.chemotechnique.se where forms for all series are available under the section “Patch Testing”.

Patient information sheet

Patient information sheets are available for each hapten, explaining where the substance can be found and if there are some known synonyms of the substance. Visit www.chemotechnique.se and go to the specific hapten and press the

-button “Patient Info” to get a printable copy.

Interpretation

After about 48 hours the patch test units are removed. Visual imprints on the skin from each chamber + a slight erythema from the frames should be visible as a sign of good occlusion. Reading of the test is preferably performed at day 3 or 4 plus at day 7 after test application for haptens that may show delayed reactions. Some clinics prefer to add an initial reading about 30 minutes after the tape units have been removed. At that point possible skin irritation from the foam frames should have subsided in the normal case. At day 3, a weak erythema from the frames might be present in patients with sensitive skin.

Use the IQ Ultra Reading Plate to facilitate the reading. For the interpretation of the test result the following scheme can be used:

IR Irritant reaction

Discrete patchy erythema without infiltration.

+++ Extreme positive reaction

- Coalescing vesicles
- Bullous or ulcerative reaction

++ Strong positive reaction

- Erythema -Infiltration
- Papules -Discrete vesicles

+ Weak positive reaction

- Erythema -Infiltration
- Papules

?+ Doubtful reaction

- Faint macular -No infiltration
- Homogenous erythema

Photopatch testing (PPT) - General information and methodology¹

What patients should be tested and what agents to test?

Primary indication should be dermatitis predominantly affecting exposed sites with or without a history of a sunscreen reaction and that PPT should also be considered in patients with chronic actinic dermatitis and any individual with a photosensitive eruption for which there is no obvious diagnosis. PPT should not be undertaken when the skin test area is active. The European Photopatch Baseline Series EP-1000 is the series of choice supplemented by the additions in the European Photopatch Extended Series EPE-1000 as proposed by the Photopatch test taskforce group.²

Methodology of PPT and light source

The application area recommended is the mid upper back skin, avoiding 3-5 cm on either side of the vertebrae. Apply the agents using e.g. the IQ Ultra Chamber technique. Apply duplicate sets on left and right side of the back of the patient and leave the test units in place for either 24 or 48 h, after which both sets are removed. At this point, one set should be covered with an ultraviolet (UV) opaque material and the other irradiated with a calibrated metered broad-spectrum UVA source. The type of lamp used for testing should be noted as this may affect results. Psoralen plus UVA fluorescent lamps are preferred because of their widespread availability, reproducible spectrum and beam uniformity. One choice of equipment is the UV-Therapy and Photodiagnosis system UV 802 L from Waldmann.

Choice of ultraviolet dose

The UVA dose must be sufficient to trigger the photo allergy response without causing a false-positive or phototoxic response. The recommended dose is 5 J/cm² for routine PPT.

Timing of readings

Readings should be recorded using the International Contact Dermatitis Research Group (ICDRG) scoring system with readings before irradiation, immediately after irradiation and 48 h after irradiation. Further readings at 72 and 96 h postirradiation are desirable to enable detection of crescendo or decrescendo scoring patterns suggesting allergic and non-allergic mechanisms, respectively. A positive reaction to a photohapten and light in the presence of negative 'contact' and 'irradiation' controls strongly

UV-Therapy and Photodiagnosis system UV 802 L from Waldmann

...world leader in patch testing

supports a photoallergic mechanism, particularly where a strengthening response over the reading time points is recorded. At the same time, it is important to recognize that non-irradiated test site results due to irritancy/allergy or photoaggravation (at the irradiated site) of an irritant/allergic reaction, phototoxicity and awareness of the possibility of a technical error, should all be identified and recorded.

Relevance of readings

It is important to record the relevance of the result using a system such as COA-DEX. This classifies clinical relevance of positive allergic patch test reactions as:

- current relevance (the patient has been exposed to a hapten during current episode of dermatitis and improves when the exposure ceases);
 - old or past relevance (past episode of dermatitis from exposure to haptens);
 - actively sensitized [patient presents with a sensitization (late) reaction];
 - relevance not known (not sure if exposure is current or old);
 - cross-reaction (the positive test is due to cross-reaction with another hapten);
 - exposed (a history of exposure but not resulting in dermatitis from that exposure or no history of exposure but a definite positive allergic patch test).
- (C = current; 0= old; A = actively sensitized; D = do not know; EX = exposed).

Testing the ultraviolet A photosensitive or immunosuppressed patient

When photopatch testing a patient who has an abnormal UVA sensitivity, it is advisable to establish the UVA minimal erythema dose (MED) prior to PPT. Although there is a lack of recommended dose series data, it is important to test up to and including 5 J/cm² with the same UVA source as used for PPT. If the MED detected at 24 h is less than the lowest dose, it is advisable to use 50% of this value with an awareness of the increased possibility of photoaggravated irritant and contact reactions. Although concomitant systemic or topical immunosuppression/antihistaminic action may result in a false-negative result, a positive response will be valid. In the absence of published data on the duration/degree of immunosuppressive effect, it is recommended when clinically feasible, that such therapy should be stopped for at least 2 weeks prior to PPT investigation.

The Hydroperoxides of Linalool and Limonene

Linalool is a naturally occurring terpene alcohol chemical found in many flowers and spice plants with many commercial applications, the majority of which are based on its pleasant scent.

Limonene takes its name from the lemon, as the rind of the lemon, contains considerable amounts of this compound, which contributes to the odor.

Both fragrances are very common in cosmetic products, such as perfumes and creams. The hydroperoxides are formed when Limonene and Linalool are exposed to sunlight and air.

Research including multicenter and repeated open application test (ROAT) studies, where Chemotechnique Diagnostics have been involved, have shown that the hydroperoxides are the molecules that cause the allergies – not the unoxidized perfume ingredient.

Swedish national television news broadcasted, in October 2013, two reports covering an outbreak of allergic contact dermatitis caused by these haptens.

ACETAMINOPHEN

A-032	$C_8H_9NO_2$	151.16	CAD
-------	--------------	--------	-----

Paracetamol or acetaminophen, is the active metabolite of phenacetin, a so-called coal tar analgesic. It is an effective substitute for acetylsalicylic acid, due to its analgesic (to relieve minor aches and pains) and antipyretic (to reduce fever) properties. However, unlike aspirin, it is not a very effective anti-inflammatory agent though it lacks many of the side effects of aspirin, and is available over-the-counter. Paracetamol is also useful in the management of more severe pain, where it allows lower dosages of additional non-steroidal anti-inflammatory drugs (NSAIDs) or opioid analgesics to be used, thereby minimizing overall side effects. It is a major ingredient in numerous cold and flu medications. **CAS** 103-90-2.

Amoxicillin trihydrate			
A-030	$C_{16}H_{19}N_3O_5S$	365.40	CAD

Amoxicillin or amoxycillin is a moderate-spectrum β -lactam antibiotic used to treat bacterial infections caused by susceptible microorganisms. It is usually the drug of choice within the class because it is better absorbed, following oral administration, than other beta-lactam antibiotics. Amoxicillin is susceptible to degradation by β -lactamase-producing bacteria, and so may be given with clavulanic acid to decrease its susceptibility. Is currently marketed by GlaxoSmithKline (the inheritor company) under the original trade name Amoxil. **CAS 26787-78-0.**

-------	-----------------------	--------	-----

First-generation cephalosporin antibiotic and it is an orally-administered agent with a similar antimicrobial spectrum to the intravenous agents cefalotin and cefazolin. It is used to treat urinary tract infections, respiratory tract infections (including sinusitis, otitis media, pharyngitis, tonsillitis and pneumonia), skin and soft tissue infections. Although it is not generally considered first-line therapy for any indication, it is a useful alternative to penicillins in patients with penicillin hypersensitivity. There is, however, cross-reactivity in 10% of patients with hypersensitivity to penicillins and carbapenems.

-------	--------------------------------	--------	-----

Diltiazem HCl is a member of the group of drugs known as benzothiazepines, which are a class of calcium channel blockers, used in the treatment of hypertension, angina pectoris, and some types of arrhythmia. It is a class 3 anti-anginal drug, and a class IV antidysrhythmic. It incites very minimal reflex sympathetic changes. **CAS** 33286-22-5.

DIMETHYLAMINOETHYL METHACRYLATE

D-045	$C_8H_{15}NO_2$	157.21	DS, MA, DMP
-------	-----------------	--------	-------------

Used as amine activator in visible light-cured dental acrylic composite materials. Also known as N,N-Dimethylaminoethyl methacrylate. **CAS** 2867-47-2.

3-(Dimethylamino)-1-propylamine

D-053	$C_5H_{14}N_2$	102.18	C, E
-------	----------------	--------	------

This is an intermediate substance in the synthesis of alkylamidopropyl dimethylamines/alkylamidobetaines and found as an impurity in cosmetic surfactants present in e.g. shampoos. 3-(Dimethylamino) propylamine is also used as a hardener of epoxy resins, as an additive in fuel, dyes, pesticides and binding agents. It is also used in the production of ion-exchangers. Also known as DMPA. **CAS** 109-55-7.

Dimethyl dihydroxy ethylene urea

Limonene is found in cosmetics, fine fragrances and hygiene products as well as in household and industrial products. Limonene is one of the most commonly found fragrance ingredients in consumer products presently available. Limonene is a naturally occurring terpene, present in large amounts in various citrus fruits. Limonene autoxidize on air exposure at room temperature forming hydroperoxides. Compared to pure unoxidized limonene the hydroperoxides of oxidized limonene have shown to be far more allergenic. **NOTE: The preparation contains oxidized d-limonene. The concentration of the active haptens in the preparation is measured from the total amount of the hydroperoxides of d-limonene.**

d-Limonene

L-006	$C_{10}H_{16}$	136.24	F
-------	----------------	--------	---

Limonene is a hydrocarbon, classified as a cyclic terpene. It is a colourless liquid at room temperatures with an extremely strong smell of oranges. It takes its name from the lemon, as the rind of the lemon, like other citrus fruits, contains considerable amounts of this chemical compound, which is responsible for much of their smell. Limonene is a chiral molecule, and as is common with such forms, biological sources produce one enantiomer: the principal industrial source, citrus fruit, contains d-limonene ((+)-limonene), which is the R-enantiomer. Racemic limonene is known as dipentene. **CAS** 5989-27-5.

LINALOOL

L-005	$C_{10}H_{18}O$	154.25	F
-------	-----------------	--------	---

Linalool is a naturally-occurring terpene alcohol chemical found in many flowers and spice plants with many commercial applications, the majority of which are based on its pleasant scent (floral, with a touch of spiciness). It is a main constituent of oils of rosewood, Ho, lavender, lavandin, clary sage, bergamot, petitgrain; minor of neroli, tangerine and jasmine. It has other names such as Linalool synthetic, β -linalool, linalyl alcohol, linaloyl oxide, p-linalool, allo-ocimanol, 2,6-dimethyl-2,7-octadien-6-ol and linalool synthetic. **CAS** 78-70-6.

MANGANESE CHLORIDE

M-031	Cl_2Mn	125.84	MET
-------	----------	--------	-----

MANGANESE CHLORIDE describes a series of compounds with the formula $MnCl_2(H_2O)_x$, where the value of x can be 0, 2, or 4. Many Mn(II) salts are pink. MANGANESE CHLORIDE is used as a catalyst in the chlorination of organic compounds, in animal feed, and in dry-cell batteries. Metallic manganese is used primarily in steel production to improve hardness, stiffness, and strength. It is also used in carbon steel, stainless steel, and high-temperature steel, along with cast iron and superalloys. **CAS** 7773-01-5.

-------	-----	-------	-----

Titanium nitride (sometimes known as Tinite) is an extremely hard, ceramic material, often used as a coating on Titanium alloy, steel, carbide, and aluminium components to improve the substrate's surface properties. Far and away the most common use for TiN coating is for edge retention and corrosion resistance on machine tooling, such as drill bits and milling cutters. Because of TiN's metallic gold color, it is used to coat costume jewelry and automotive trim for decorative purposes. TiN is also widely used as a top-layer coating, usually with nickel (Ni) or chromium (Cr) plated substrates, on

TOCOPHEROL

T-036	$C_{29}H_{50}O_2$	430.71	ICB, C
-------	-------------------	--------	--------

DL-Alpha-tocopherol is the form of vitamin E that is preferentially absorbed and accumulated in humans. In general, food sources with the highest concentrations of vitamin E are vegetable oils, followed by nuts and seeds including whole grains. Although originally extracted from wheat germ oil, most natural vitamin E supplements are now derived from vegetable oils, usually soybean oil. Vitamin E is widely used as an inexpensive antioxidant in

cosmetics and foods. Vitamin E containing products are commonly used in the belief that vitamin E is good for the skin; many cosmetics include it, often labeled as tocopherol acetate, tocopheryl linoleate or tocopheryl nicotinate. Some individuals experience allergic reactions to some tocopheryl esters or develop a rash and hives that may spread over the entire body from the use of topical products with alpha tocopheryl esters. **CAS** 10191-41-0.

TOCOPHERYL ACETATE

T-037	$C_{31}H_{52}O_3$	472.75	C
-------	-------------------	--------	---

Tocopheryl acetate, also known as vitamin E acetate, is a common vitamin supplement. It is the ester of acetic acid and tocopherol (vitamin E). It is often used in dermatological products such as skin creams. Tocopheryl acetate is used as an alternative to tocopherol itself because the phenolic hydroxyl group is blocked, providing a less acidic product. It is believed that the acetate is slowly hydrolyzed once it is absorbed into the skin, regenerating tocopherol and providing protection against the sun's ultraviolet rays. **CAS** 7695-91-2.
